

# Free-Flight Tests on Kites in the $24-\mathrm{ft}$ Wind Tunnel 

## By

S. B. Jackson, B.Sc.<br>Communicated by the Principal Director of Scientific Research (Air) Ministry of Supply

Reports and Memoranda No. $2599^{*}$
March, 1942

Summary.-Reasons for Enquiry.-Tests were required to be made on six kites over a greater range of wind speed than for previous large-tunnel tests.

Range of Investigation.-The kites used during the investigation were (A) 3-ft Cody kite Mk. II, (B) 3-ft reversed Cody or Dyco kite, (C) 3 -ft Haldon kite, (D) $2 \times 3$-ft Cody storm kite with lateral cross-bracing, (E) 2-ft Cody kite Mk. III with bifurcated inner bridle and (F) 2-ft Cody kite Mk. III with longitudinal bracing.

Tests were made over the whole stable range of the kites and up to the highest safe wind speed. The kites were flown from a pylon and values of lift, drag and incidence of the forward and rear bridles were measured. Attempts were also made on two of the 3 - ft kites ( A and C ) to improve their stability at higher wind speeds and low incidences.

Conclusions.-The maximum value of $(L-W) / D$ was below 2.5 and values of $C_{L}$, based on the fabric surface area, excluding the vertical panels, were not greater than 0.9 .

The unmodified kites are unsuitable for high wind speeds. At low incidences, the kites tend to fall away from their flying position at speeds above $70 \mathrm{ft} / \mathrm{sec}$, but this can be temporarily delayed by diagonal cross-bracing to lift the centre of the leading edges of the front lifting panels, and by tying the wing tips together. At high incidences, bending of the bamboos may disrupt the kite and it is recommended that a bifurcated bridle, which picks up at four points on each lower longitudinal, be used to prevent this bending. The parallel-rigged wing canes tend to take up a negative incidence as the lower longitudinals bend under load, and thus cause bending of the transverse bamboos. This can be avoided by using cross-rigging, the wing canes then taking up a slight positive incidence. The flapping of the vertical panels, which limits the usefulness of the kites at higher speeds, can be moderated by stiffening canes sewn in the fabric in a fore and aft direction.

1. Introduction.-At the request of Research Department, Exeter, tests were made on a number of Cody-type kites to obtain data over a range of incidence and at higher speeds than those obtained in previous large wind-tunnel tests. The method of testing in the 24 - ft windtunnel has also been improved so that the kites experience more nearly the actual flight conditions.

2 Description of Kites.-The following kites were used during the tests:-
(A) 3-ft Cody kite Mk. II (Figs. 1, 2). -This is a double-cell box kite with protruding diagonal bamboos supporting wings. Those from the upper surface of the front box are longer than the others.
(B) 3-ft Dyco or reversed Cody kite.-This differs from the Cody kite in that the lengthened wings are carried from the upper surface of the rear box instead of the front box.
(C) 3-ft Haldon kite.-This differs from the Cody kite in having the lengthened wings cut back to the same size as the other wings.

[^0](90130)
(D) $2 \times 3$-ft Cody storm kite with lateral cross-bracing as shown in Fig. 3.-This kite is scaled down from the 3 -ft Cody kite, horizontally but not vertically, and, in addition, has a horizontal spar lashed to the two lower longitudinals at the leading edge of the bottom panel of the rear box.
(E) 2-ft Cody kite Mk. III with bifurcated inner bridle (see Fig. 4).-This kite is scaled down from the 3 -ft Cody kite, although the distance between the front and rear boxes is larger than it would be for a true two-third scale model. The bifurcated inner bridle is designed to prevent distortion of the bamboos.
(F) 2-ft Cody kite Mk. III with longitudinal bracing (see Fig. 3). -The longitudinal crossbracing is also intended to prevent distortion of the bamboos and obviate shearing between the upper and lower longitudinals.
3. Experimental Procedure.-The normal kite has 4 attachment points from which two forward and two rear bridles depend. In flight, each forward and rear bridle on each side is attached to an intermediate bridle and the two intermediate bridles are in turn attached to the flying line. The inclination of the bridle introduces transverse stresses into the kite structure with consequent deformation. In previous wind-tunnel tests the suspension has been by parallel wires which did not introduce any transverse strain. The present tests were designed to reproduce as exactly as possible the flight conditions. For this purpose the junctions of the bridle with the intermediates were attached to a tube transverse to the wind direction and mounted on a pylon (see Figs. 1, 2). The two attachment points were spaced to agree with flight conditions. Thus, as long as the kite remained steady, the forces on the kite should be as in flight but if the kite yawed then the flight conditions were upset. With this arrangement the kite took up a flying incidence depending on the length of the forward and rear bridles. These lengths were varied during the test over the stable range of the kites*.

Measurements of incidences were taken with a ' Robot ' camera using 35 mm . film, from which, on projection, bridle angles and the kite incidence could be obtained, the datum line for the latter being taken as the line joining the intersection of the bridles with the lower boom. Measurements of angles of incidence may not be more accurate than $\pm 1 / 2$ deg. From the measurements of bridle angles, the mean tensions in the bridles have been calculated. In these calculations the fact that the bridles are not in vertical planes, but converge below the kite, has been neglected. The maximum error due to this cause is about 4 per cent. and the error arising from the measurement of the bridle angles is about $\pm 5$ per cent.
4. Results.-Numerical results are given in Tables 1 to 7 whilst Figs. 6, 7 show curves of $(L-W) / D$ against $C_{L}$ for various wind speeds and bridle lengths, $W$ being the weight of the kite. The maximum value of $(L-W) / D$ obtained was below $2 \cdot 5$ and values of $C_{L}$, based on the fabric surface area excluding the vertical panels, were not greater than $0 \cdot 9$.
5. Discussion of Results.-5.1. Distortion Due to Wind.-General observations on the series of kites showed that on increasing the wind speed for constant bridle lengths, the kite incidence tends to decrease whilst the value of ( $L-W$ )/D $\dagger$ (tangent of the angle of the flying line) increases. The longer the rear bridles, the greater the decrease in $C_{L}$ and the smaller the increase in $(L-W) / D$. If, however, the incidence is decreased to angles between 5 to 10 deg., there is a tendency for the shape of the front box to change radically, resulting in a decrease of lift on the front box so that the kite trims at a smaller incidence, further decreasing the front-box lift. At speeds above $70 \mathrm{ft} / \mathrm{sec}$, with the longer rear bridles the kites may become unstable and swoop

[^1]out of the jet. Using short rear bridles, the kites do not reach this low-incidence region (at moderate wind speeds) but distortion of the bamboos occurs at speeds about $100 \mathrm{ft} / \mathrm{sec}$; at higher speeds the kites were considered unsafe. A cinematograph record was taken both of the unstable condition of the kites at low incidences and of the distortions of the bamboos at high ones.
5.2. Effect of Bifurcated Bridle (Kite E, Fig. 3, Table 5). -Much of the bending was eliminated by the use of a bifurcated inner bridle on one of the 2 - ft kites (kite E). This kite, as well as the 2 -ft kite with normal rigging (kite F) and the $2 \times 3$-ft storm kite (kite D ), was considered to be quite safe, except at low incidences, at $120 \mathrm{ft} / \mathrm{sec}$. Table 5 gives results obtained with the bifurcated bridle and shows that there was a smaller incidence change with wind speed than with normal bridles of similar lengths and that $C_{L}$ remains almost constant. It would therefore appear that much of the change of incidence with wind speed obtained with normal rigging is due to distortion of the bamboos.
5.3. Effect of Stiffening Canes for Fabric (Kite D, Fig. 3, Table 4). -The $2 \times 3$-ft Cody kite (kite D) was also subject to less bending than the 3 -ft kites and the 2 -ft kite Mk. III with normal rigging, and its general behaviour was similar to the $2-\mathrm{ft}$. Mk. III with bifurcated bridle, but had a lower lifting efficiency (see Tables 4, 5, Fig. 7). The side canes in the fabric of the rear box prevented much of the flapping associated with the vertical panels. Additional tests with the $2 \times 3$-ft kite were carried out with the wire-bracing shown in Fig. 3, which prevented a tendency for the upper ends of the forward cross spars to bend and close the front box. This wire-bracing also slightly increased the lifting efficiency of the kite (directly proportional to the tangent of the flying line) at higher wind speeds (Fig. 7).
5.4. Use of Longitudinal Cross-bracing (Kite F, Fig. 4. Table 6).-The longitudinal crossbracing on the $2-\mathrm{ft}$ Cody kite Mark III (kite F) served little to reduce the bending of the longitudinals but prevented shear between the upper and lower booms. (It had previously been noted that kite $D$ had considerable shearing of the upper longitudinals with respect to the lower ones.) At the same value of $C_{L}$, kite F also had a lower lifting efficiency than kite E with bifurcated inner bridle (see Fig. 7).
6. Further Modifications to 3 -ft Kites.-Some further tests (Tables 7a, b, c, Fig. 8) were done with the 3 -ft Haldon and Cody Mk. II (kites C and A respectively) with the object of improving the stability of the kites at low incidence without adversely affecting their lifting efficiency. The most promising results were obtained with a diagonal cord (AGA' in Fig. 5) lashed to the centre cane of the lower panel of the front box, at its leading edge. This was done in order to prevent collapsing of this panel, it having previously been found that before the kites lose height, the shape of the lifting panels of the front box changes, the points $F$ and $G$ (Fig. 5) moving downwards. This alteration in the shape of the lifting surface is usually found in the rear box before any change occurs in the front one but appears not to cause any loss of stability, the lite remaining quite steady after the leading edges ( L and M ) of the centre canes have moved below $\mathrm{KK}^{\prime}$ and $\mathrm{PP}^{\prime}$ respectively. It was found advisable, however, to lash a thin vertical spar FG , in the front box, to prevent the top lifting panel collapsing, even when the lower panel is stayed by the cord AGA'.

In the case of the Haldon kite (kite C, Table 7a, Fig. 8) improvement made in the lifting efficiency of the kite was only very slight, but the kite could be made fairly steady at $80 \mathrm{ft} / \mathrm{sec}$ although above this, it had little margin of stability. Experiments to increase the back-box lift with respect to the front-box lift indicated that this instability is associated with a rapid backwards movement of the centre of pressure of the kite on increasing wind speed at low incidence.
Using a 3 -ft Cody kite (Kite A) with 4 -ft front and 8 -ft rear bridles, the rear bridle was just slack (the kite flying only on the front rigging loops), and at speeds above $70 \mathrm{ft} / \mathrm{sec}$ the kite was
unstable, swooping to the side of the jet. A fair improvement in stability was obtained by using a wire or cord AGA' (Fig. 5) and a spar FG, with little change in the lifting efficiency of the kite (Fig. 8, Table 7). It was found here that the wings tend to take up a negative incidence at high wind speeds and thus close the front box. This will occur with parallel rigging of the wing canes ED and $\mathrm{E}^{\prime} \mathrm{D}^{\prime}$ and for high bending moments in the booms, but it is not likely to occur with cross-rigged wing canes. To prevent collapsing of the front box; the wing tips $\mathrm{CC}^{\prime}$ were joined by cord (ciné film records were taken of this at $100 \mathrm{ft} / \mathrm{sec}$.).
7. Effect of Tilting the Wing Canes.--Some further tests were carried out with the 3 -ft Cody kite Mk. II (Kite A) using front bridles of 4 ft with rear bridles of 7 ft 6 in . The kite is more stable than with 8 - ft rear bridles, but still has a tendency to swoop out of the jet, provided the wind speed is raised sufficiently (approximately $90 \mathrm{ft} / \mathrm{sec}$.). The wing canes were here given a slight, (approximately 5 deg.), and later a marked, (approximately 20 deg .), positive incidence with respect to the lower booms to prevent bending of the wings due to their having a negative incidence above $80 \mathrm{ft} / \mathrm{sec}$ and taking a down-load which caused both bending of the transverse bamboos and closing of the front box. A marked increase in lift above normal rigging was thus obtained (Table 7c, Fig. 8) at the cost of a correspondingly higher drag at $80 \mathrm{ft} / \mathrm{sec}$ and the kite shuddered violently in flight.
8. Effect of cutting Away Part of the Lifting Surfaces.-Wool tufts placed on the lifting panels of the front box of this kite indicated that the upper panel was stalled. It was later decided to remove this panel, but the kite flew at a much lower incidence and swooped out of the jet below $50 \mathrm{ft} / \mathrm{sec}$. The upper lifting panel of the rear box was then removed and the kite had a greater incidence and was able to be flown at $60 \mathrm{ft} / \mathrm{sec}$. The lifting efficiencies of the kite under these conditions were low (Table 7c, Fig. 8) but in flight, it was extremely steady owing to the high ratio of non-lifting to lifting surfaces.

Conclusions.-The unmodified 3-ft kites can be flown at wind speeds up to $100 \mathrm{ft} / \mathrm{sec}$, but are unsuitable for higher speeds if set at high or low incidences. At low incidences, the fall of incidence with wind speed, which is due, partly to the increase of the aerodynamic forces compared with its weight, and partly to distortion of the kite, results in a reduction of lift on the panels of the front box, which consequently changes their shape, and the kite becomes unstable. At high incidences, the large forces involved at high speeds bend the longitudinal and transverse bamboos and may break them. Flapping of the vertical panels also limits the usefulness of some of the kites at high speeds.

The bending of the bamboos can be prevented by using bifurcated bridles, which pick up at four points on each of the lower longitudinals. To some extent, the distortion of the kites under high loads can also be prevented by longitudinal bracing between the upper and lower bamboos on each side, but this does not prevent the ordinary bending of the bamboos.

The sharp reduction of lift on the front box at low incidence can be delayed by diagonal crossbracing to lift the centre of the leading edges of the lifting panels, and by tying the wing tips together (cords joining $\mathrm{AGA}^{\prime}$ and $\mathrm{CC}^{\prime}$ and strut from F to G in Fig. 5). Bending of the transverse bamboos can be reduced by using cross rigged wing canes (cords joining HD, $\mathrm{H}^{\prime} \mathrm{D}^{\prime}, \mathrm{EB}, \mathrm{E}^{\prime} \mathrm{B}^{\prime}$ in Fig. 5). The present arrangement of parallel rigging (as shown in Fig. 5) tends to close the front box as the lower longitudinals bend under load. The flapping of the vertical panels can be moderated by stiftening canes sewn in the fabric in a fore and aft direction.

* Owing to flabbiness of the vertical side panels of the 2-ft. Mk. III Cody kite originally used, these tests were carried out with the remaining 2 -ft kite (Table 5) with the bifurcated bridle removed and the lateral bracing replaced.

TABLE 7 (a)
3-ft Haldon Kite with 4-ft Front, 7 ft 6 in. Rear Bridles (Kite C)

| Kite rigging (see Fig. 5) | Wind speed $\mathrm{ft} / \mathrm{sec}$ | $\underset{\mathrm{lb}}{\mathrm{Lift}}$ | $\underset{\mathrm{lb}}{\text { Drag }}$ | $\frac{L-W}{D}$ | Nominal incidence (deg.) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Normal rigging .... .. .. .. | $\begin{aligned} & 40 \\ & 60 \\ & 73 \cdot 8 \end{aligned}$ | $\begin{array}{r} 66 \\ 114 \\ 153 \end{array}$ | $\begin{aligned} & 25 \cdot 6 \\ & 50 \cdot 5 \\ & 70 \cdot 9 \end{aligned}$ | $\begin{aligned} & 1 \cdot 76 \\ & 1.84 \\ & 1.86 \end{aligned}$ | $\begin{array}{r} 11.5 \\ 9 \cdot 6 \\ 10.5 \end{array}$ |
| Spars at $\mathrm{BB}^{\prime} \mathrm{KK}^{\prime}$ with points G and L lashed to these spars respectively, to prevent distortion of the two panels concerned. | $\begin{aligned} & 30 \\ & 40 \\ & 50 \end{aligned}$ | $\begin{aligned} & 46 \\ & 53 \\ & 59 \end{aligned}$ | $\begin{aligned} & 19 \cdot 7 \\ & 22 \cdot 7 \\ & 30 \cdot 5 \end{aligned}$ | $\begin{aligned} & 1 \cdot 17 \\ & 1 \cdot 32 \\ & 1 \cdot 18 \end{aligned}$ | $\begin{array}{r} 14 \cdot 7 \\ 10 \cdot 0 \\ 8 \cdot 1 \end{array}$ |
| Spars removed and cord lashed from $A$ to $G$ to $A^{\prime}$ to give bottom panel a slight camber and prevent it from dipping. | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \\ & 80 \end{aligned}$ | $\begin{array}{r} 49 \\ 68 \\ 94 \\ 121 \\ 145 \end{array}$ | $\begin{aligned} & 21 \cdot 5 \\ & 27 \cdot 7 \\ & 38 \cdot 7 \\ & 54 \cdot 0 \\ & 81 \cdot 7 \end{aligned}$ | $\begin{aligned} & 1.30 \\ & 1.70 \\ & 1.89 \\ & 1.85 \\ & 1.52 \end{aligned}$ | $\begin{array}{r} 14 \cdot 7 \\ 10 \cdot 0 \\ 8 \cdot 9 \\ 8 \cdot 0 \\ 5 \cdot 4 \end{array}$ |
| As above but cord AGA' tightened.. | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \\ & 80 \end{aligned}$ | $\begin{array}{r} 49 \\ 72 \\ 100 \\ 130 \\ 201 \end{array}$ | $\begin{aligned} & 24 \cdot 0 \\ & 31 \cdot 7 \\ & 42 \cdot 0 \\ & 57 \cdot 1 \\ & 97 \cdot 2 \end{aligned}$ | $\begin{aligned} & 1 \cdot 17 \\ & 1.61 \\ & 1.88 \\ & 1.91 \\ & 1.86 \end{aligned}$ | $\begin{array}{r} 14 \cdot 8 \\ 11 \cdot 8 \\ 11 \cdot 3 \\ 9 \cdot 2 \\ 9 \cdot 4 \end{array}$ |
| Rear box stayed as for front box (cord KMK') . . | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \end{aligned}$ | $\begin{array}{r} 48 \\ 71 \\ 93 \\ 115 \end{array}$ | $\begin{aligned} & 22 \cdot 4 \\ & 30 \cdot 1 \\ & 37 \cdot 9 \\ & 50 \cdot 6 \end{aligned}$ | $\begin{aligned} & 1 \cdot 21 \\ & 1 \cdot 66 \\ & 1 \cdot 90 \\ & 1 \cdot 86 \end{aligned}$ | $\begin{array}{r} 14 \cdot 5 \\ 9 \cdot 5 \\ 8 \cdot 2 \\ 7 \cdot 3 \end{array}$ |
| Cords AGA' and KMK' with spars FG, LM lashed to centre canes at F, G, L and M. | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \\ & 80 \end{aligned}$ | $\begin{array}{r} 49 \\ 66 \\ 87 \\ 102 \\ 87 \end{array}$ | $\begin{aligned} & 22 \cdot 9 \\ & 27 \cdot 7 \\ & 36 \cdot 0 \\ & 47 \cdot 3 \\ & 75 \cdot 6 \end{aligned}$ | $\begin{aligned} & 1 \cdot 14 \\ & 1 \cdot 55 \\ & 1 \cdot 78 \\ & 1 \cdot 67 \\ & 0 \cdot 85 \end{aligned}$ | $\begin{array}{r} 14 \cdot 1 \\ 9 \cdot 7 \\ 7.9 \\ 6 \cdot 9 \end{array}$ <br> Crashing |
| Spar LM and cord KMK' removed . . | $\begin{array}{r} 30 \\ 40 \\ 50 \\ 60 \\ 80 \\ 100 \end{array}$ | $\begin{array}{r} 48 \\ 66 \\ 93 \\ 120 \\ 181 \\ 174 \end{array}$ | $\begin{array}{r} 23 \cdot 2 \\ 27 \cdot 8 \\ 38 \cdot 2 \\ 53 \cdot 3 \\ 91 \cdot 6 \\ 121 \cdot 1 \end{array}$ | $\begin{aligned} & 1 \cdot 12 \\ & 1.58 \\ & 1.86 \\ & 1.84 \\ & 1.74 \\ & 1.26 \end{aligned}$ | $\begin{array}{r} 16 \cdot 0 \\ 11.6 \\ 8 \cdot 8 \\ 8.5 \\ 7.9 \\ 6 \cdot 0 \end{array}$ |

TABLE 7 (b)
3-ft Cody Kite Mk. II with 4-ft Front and 8-ft Rear Bridles (Kite A)

| Kite rigging (see Fig. 5) | Wind speed $\mathrm{ft} / \mathrm{sec}$ | Lift lb | Drag lb | $\frac{L-W}{D}$ | Nominal incidence (deg.) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Normal rigging .. .. .. | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \end{aligned}$ | $\begin{array}{r} 56 \\ 75 \\ 98 \\ 118 \end{array}$ | $\begin{aligned} & 19 \cdot 1 \\ & 24 \cdot 9 \\ & 36 \cdot 8 \\ & 51 \cdot 9 \end{aligned}$ | $\begin{aligned} & 1 \cdot 73 \\ & 2 \cdot 09 \\ & 2 \cdot 04 \\ & 1 \cdot 83 \end{aligned}$ | $\begin{array}{r} 12 \cdot 2 \\ 8 \cdot 0 \\ 7 \cdot 9 \\ 7 \cdot 5 \end{array}$ |
| Spar FG and 5 -cwt cable AGA' ; spar lashed to central canes at F and G . | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \\ & 80 \end{aligned}$ | $\begin{array}{r} 57 \\ 80 \\ 109 \\ 142 \\ 203 \end{array}$ | $\begin{array}{r} 20 \cdot 4 \\ 27 \cdot 4 \\ 40 \cdot 7 \\ 58 \cdot 3 \\ 100 \cdot 7 \end{array}$ | $\begin{aligned} & 1 \cdot 62 \\ & 2 \cdot 04 \\ & 2 \cdot 09 \\ & 2 \cdot 02 \\ & 1 \cdot 78 \end{aligned}$ | $\begin{array}{r} 12 \cdot 8 \\ 10 \cdot 4 \\ 9 \cdot 9 \\ 7 \cdot 7 \\ 7.8 \end{array}$ |
| As above but cable tightened .. .. . | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \\ & 80 \end{aligned}$ | $\begin{array}{r} 49 \\ 82 \\ 112 \\ 144 \\ 210 \end{array}$ | $\begin{array}{r} 21 \cdot 4 \\ 29 \cdot 5 \\ 41 \cdot 6 \\ 59 \cdot 4 \\ 102 \cdot 4 \end{array}$ | $\begin{aligned} & 1 \cdot 17 \\ & 1 \cdot 97 \\ & 2 \cdot 12 \\ & 2 \cdot 02 \\ & 1 \cdot 82 \end{aligned}$ | $\begin{array}{r} 13 \cdot 1 \\ 10 \cdot 0 \\ 9 \cdot 7 \\ 8 \cdot 0 \\ 7 \cdot 3 \end{array}$ |
| Wire further tightened and wing tips $\mathrm{CC}^{\prime}$ joined by cord. | $\begin{array}{r} 30 \\ 40 \\ 50 \\ 60 \\ 80 \\ 100 \end{array}$ | $\begin{array}{r} 50 \\ 86 \\ 117 \\ 154 \\ 231 \\ 243 \end{array}$ | $\begin{array}{r} 23 \cdot 4 \\ 31 \cdot 5 \\ 44 \cdot 9 \\ 63 \cdot 2 \\ 109 \cdot 8 \\ 169 \cdot 3 \end{array}$ | $\begin{aligned} & 1 \cdot 11 \\ & 1 \cdot 97 \\ & 2 \cdot 07 \\ & 2 \cdot 06 \\ & 1 \cdot 89 \\ & 1 \cdot 29 \end{aligned}$ | $\begin{array}{r} 12 \cdot 6 \\ 10 \cdot 2 \\ 9 \cdot 8 \\ 8 \cdot 9 \\ 8 \cdot 5 \\ 8 \cdot 0 \end{array}$ |
| As above but wire AGA' replaced by cord.. | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \\ & 80 \end{aligned}$ | $\begin{array}{r} 50 \\ 86 \\ 116 \\ 155 \\ 238 \end{array}$ | $\begin{array}{r} 24 \cdot 1 \\ 32 \cdot 3 \\ 45 \cdot 1 \\ 63 \cdot 7 \\ 112 \cdot 0 \end{array}$ | $\begin{aligned} & 1 \cdot 08 \\ & 1 \cdot 92 \\ & 2 \cdot 04 \\ & 2 \cdot 06 \\ & 1 \cdot 91 \end{aligned}$ | $\begin{array}{r} 13 \cdot 2 \\ 10 \cdot 2 \\ 9 \cdot 0 \\ 8 \cdot 5 \\ 8 \cdot 9 \end{array}$ |

TABLE 7 (c)
3-ft Cody Kite MF. JI with $\frac{1}{4}$ ft Front, 7 ft. 6 in. Rear Bridles (Kite A)

| Kite rigging (see Fig. 5) | Wind speed $\mathrm{ft} / \mathrm{sec}$ | $\underset{\mathrm{lb}}{\mathrm{Lift}}$ | Drag Ib | $\frac{L .-W}{D}$ | Nominal incidence (deg.) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Normal rigging .. | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \\ & 80 \end{aligned}$ | $\begin{array}{r} 64 \\ 92 \\ 125 \\ 167 \\ 273 \end{array}$ | $\begin{array}{r} 20 \cdot 2 \\ 28 \cdot 1 \\ 41 \cdot 6 \\ 62 \cdot 4 \\ 116 \cdot 2 \end{array}$ | $\begin{aligned} & 2 \cdot 03 \\ & 2 \cdot 46 \\ & 2 \cdot 45 \\ & 2 \cdot 31 \\ & 2 \cdot 15 \end{aligned}$ | $\begin{array}{r} 15 \cdot 0 \\ 11 \cdot 3 \\ 10 \cdot 3 \\ 10 \cdot 6 \\ 9 \cdot 5 \end{array}$ |
| Spar FG and cord $A G A^{\prime}$, spar lashed to centre canes at F and G . Wing tips $\mathrm{CC}^{\prime}$ joined by cord. | $\begin{array}{r} 30 \\ 40 \\ 50 \\ 60 \\ 80 \\ 100 \end{array}$ | $\begin{array}{r} 66 \\ 95 \\ 133 \\ 181 \\ 297 \\ 312 \end{array}$ | $\begin{array}{r} 27 \cdot 2 \\ 34 \cdot 9 \\ 50 \cdot 3 \\ 71 \cdot 1 \\ 129 \cdot 4 \\ 175 \cdot 7 \end{array}$ | $\begin{aligned} & 1 \cdot 54 \\ & 2 \cdot 04 \\ & 2 \cdot 17 \\ & 2 \cdot 21 \\ & 2 \cdot 11 \\ & 1 \cdot 64 \end{aligned}$ | $\begin{array}{r} 11 \cdot 5 \\ 11 \cdot 2 \\ 10 \cdot 0 \\ 10 \cdot 8 \\ 10 \cdot 6 \\ 9 \cdot 8 \end{array}$ |
| Wing cord $\mathrm{CC}^{\prime}$ and vertical spar FG removed .. | $\begin{array}{r} 30 \\ 40 \\ 50 \\ 60 \\ 80 \\ 100 \end{array}$ | $\begin{array}{r} 65 \\ 94 \\ 130 \\ 177 \\ 281 \\ 310 \end{array}$ | $\begin{array}{r} 25 \cdot 9 \\ 32 \cdot 7 \\ 46 \cdot 1 \\ 67 \cdot 0 \\ 119 \cdot 4 \end{array}$ | $\begin{aligned} & 1 \cdot 62 \\ & 2 \cdot 17 \\ & 2 \cdot 32 \\ & 2 \cdot 30 \\ & 2 \cdot 16 \end{aligned}$ | $\begin{array}{r} 15 \cdot 0 \\ 10 \cdot 7 \\ 10 \cdot 7 \\ 10 \cdot 9 \\ 9 \cdot 4 \end{array}$ |
| Spars $\mathrm{BB}^{\prime}, \mathrm{FG}$ and cord $\mathrm{AGA}^{\prime}$. .. .. | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \\ & 80 \\ & 98 \end{aligned}$ | $\begin{array}{r} 61 \\ 85 \\ 113 \\ 148 \\ 236 \\ 278 \end{array}$ | $\begin{array}{r} 23 \cdot 8 \\ 30 \cdot 7 \\ 44 \cdot 0 \\ 61 \cdot 1 \\ 113 \cdot 7 \\ 165 \cdot 4 \end{array}$ | $\begin{aligned} & 1 \cdot 47 \\ & 1 \cdot 92 \\ & 1 \cdot 98 \\ & 2 \cdot 00 \\ & 1 \cdot 85 \\ & 1 \cdot 52 \end{aligned}$ | $\begin{array}{r} 14 \cdot 7 \\ 10 \cdot 8 \\ 8 \cdot 5 \\ 9 \cdot 5 \\ 8 \cdot 5 \\ 9 \cdot 0 \end{array}$ |
| Spar $\mathrm{BB}^{\prime}$ removed and wing canes $\mathrm{DE}, \mathrm{D}^{\prime} \mathrm{E}^{\prime}$ given slight camber by tightening cords $\mathrm{EH}, \mathrm{E}^{\prime} \mathrm{H}^{\prime}$ and slacking off $\mathrm{DB}, \mathrm{D}^{\prime} \mathrm{B}^{\prime}$. | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \\ & 80 \\ & 98 \end{aligned}$ | $\begin{array}{r} 68 \\ 98 \\ 137 \\ 188 \\ 302 \\ 374 \end{array}$ | $\begin{array}{r} 27 \cdot 9 \\ 36 \cdot 6 \\ 52 \cdot 4 \\ 74 \cdot 8 \\ 132 \cdot 5 \\ 183 \cdot 8 \end{array}$ | $\begin{aligned} & 1 \cdot 58 \\ & 2 \cdot 02 \\ & 2 \cdot 16 \\ & 2 \cdot 19 \\ & 2 \cdot 10 \\ & 1 \cdot 90 \end{aligned}$ | $\begin{array}{r} 15 \cdot 0 \\ 12 \cdot 5 \\ 9 \cdot 9 \\ 9 \cdot 4 \\ 9 \cdot 5 \\ 10 \cdot 0 \end{array}$ |
| Spar FG removed but cord bracing retained .. | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \\ & 80 \end{aligned}$ | $\begin{array}{r} 71 \\ 101 \\ 139 \\ 190 \\ 303 \end{array}$ | $\begin{array}{r} 28 \cdot 1 \\ 37 \cdot 3 \\ 52 \cdot 7 \\ 73 \cdot 9 \\ 132 \cdot 3 \end{array}$ | $\begin{aligned} & 1 \cdot 71 \\ & 2 \cdot 09 \\ & 2 \cdot 20 \\ & 2 \cdot 26 \\ & 2 \cdot 12 \end{aligned}$ | $\begin{array}{r} 15 \cdot 2 \\ 12 \cdot 0 \\ 9 \cdot 9 \\ 9 \cdot 8 \\ 9 \cdot 1 \end{array}$ |
| Spar HNH' and trailing edge of centre cane GN lashed to it at N . Cord bracings removed. | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \\ & 80 \end{aligned}$ | $\begin{array}{r} 72 \\ 103 \\ 143 \\ 193 \\ 306 \end{array}$ | $\begin{array}{r} 30 \cdot 3 \\ 39 \cdot 8 \\ 57 \cdot 0 \\ 78 \cdot 7 \\ 137 \cdot 5 \end{array}$ | $\begin{aligned} & 1 \cdot 58 \\ & 1 \cdot 99 \\ & 2 \cdot 09 \\ & 2 \cdot 15 \\ & 2 \cdot 05 \end{aligned}$ | $\begin{aligned} & 14 \cdot 0 \\ & 11 \cdot 8 \\ & 11 \cdot 3 \\ & 12 \cdot 0 \\ & 13 \cdot 3 \end{aligned}$ |
| As above with high camber on wings by tightening EH $\mathrm{E}^{\prime} \mathrm{H}^{\prime}$. | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \\ & 80 \end{aligned}$ | $\begin{array}{r} 79 \\ 122 \\ 190 \\ 256 \\ 430 \end{array}$ | $\begin{array}{r} 48 \cdot 1 \\ 68 \cdot 3 \\ 99 \cdot 1 \\ 136 \cdot 3 \\ 230 \cdot 3 \end{array}$ | $\begin{aligned} & 1.14 \\ & 1.44 \\ & 1.68 \\ & 1.70 \\ & 1.76 \end{aligned}$ | $\begin{aligned} & 15 \cdot 6 \\ & 17 \cdot 0 \\ & 15 \cdot 2 \\ & 14 \cdot 0 \\ & 12 \cdot 0 \end{aligned}$ |
| Top lifting panel of front box cut out, centre cane and webbing retained. | $\begin{aligned} & 30 \\ & 40 \end{aligned}$ | $\begin{aligned} & 50 \\ & 61 \end{aligned}$ | $\begin{aligned} & 19 \cdot 5 \\ & 24 \cdot 8 \end{aligned}$ | $\begin{aligned} & 1 \cdot 38 \\ & 1 \cdot 53 \end{aligned}$ | $\begin{aligned} & 8 \cdot 2 \\ & 8 \cdot 6 \end{aligned}$ |
| Top lifting panel of rear box also removed, in similar fashion to above. | $\begin{aligned} & 30 \\ & 40 \\ & 50 \\ & 60 \\ & \hline \end{aligned}$ | $\begin{array}{r} 55 \\ 72 \\ 96 \\ 139 \end{array}$ | $\begin{aligned} & 22 \cdot 7 \\ & 28 \cdot 6 \\ & 46 \cdot 0 \\ & 65 \cdot 3 \end{aligned}$ | $\begin{aligned} & 1 \cdot 41 \\ & 1 \cdot 71 \\ & 1.59 \\ & 1.78 \end{aligned}$ | $\begin{array}{r} 15.8 \\ 9 \cdot 8 \\ 10 \cdot 5 \\ 7.1 \\ \hline \end{array}$ |

[^0]:    * R.A.E. Report Aero. 1737.

[^1]:    * In order to safeguard the wind-tunnel fan on possible destruction of the kite at the higher wind speeds, a wire net 18 ft square, of $14 \mathrm{~s} . \mathrm{w} . \mathrm{g}$., $1 \frac{3}{4}-\mathrm{in}$. mesh was prepared and suspended behind the pylon. Lengths of 5 cwt steel cable were lashed to the four longitudinals of each of the 3-ft kites, as an additional safety device in case of disruption of the bamboos.
    $\dagger$ The ratio $(L-W) / D$ is an important factor in kite design and in this report it will be referred to as the lifting efficiency of the kite.

[^2]:    $S=89 \cdot 2$ sq. ft, $\quad W \doteq 21 \mathrm{lb}$

    * See end of Table 1
